

Problem Sheet Week 3

Save your answer in your problem sheet repository, I will look at it at the end of the semester, so don't worry if you don't get it 100% right this week.

1. Write a program (bitcoin.py) that outputs the current bitcoin price in US Dollars. You may use the code snippet below to get a Dict object that contains the price.
2. Extra output all the price in the three currencies, in a neat way.

Note

You may need to run `pip install requests` to get the requests module.

```
pip install requests
```

Sample code that gets the JSON

```
url = "https://api.coindesk.com/v1/bpi/currentprice.json"
returnedData = requests.get(url)

bitCoinDict = returnedData.json()

print(bitCoinDict)
```
